

Design Creation Principles

1. USABILITY

First

Always keep the user at the center of the design process and prioritize their needs and preferences since dealer one is a functional asset, and would need the designers to prioritise usability over marketing.

Easily distinguishable separators within and outside components to help the user understand where one section ends and another begins. Ex - Gutter space between components and margin & spacing within components have been clearly defined in the library.

Relevant
assistance

Provide users with guidance, support, or information that is directly related to their current context or needs. Ex - Provision for Info icons have been given on a majority of the components within the library.

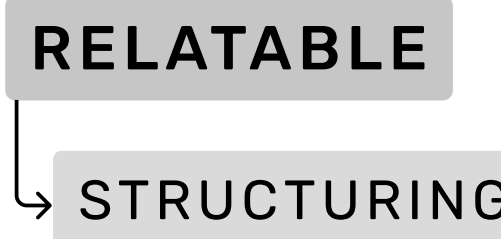

The 13 dark patterns defined by the DDPI need to be avoided to provide the users a cleaner and more transparent experience. Ex - Falsely creating a sense of urgency to trick the customer into making the decision quickly.

Use more graphical symbols (icons) to convey information and functionality than images. This enhances visual clarity, reduces cognitive load, and promotes faster comprehension for users.

Ensure interactive elements like buttons are easily accessible on touch devices, positioned within the user's natural thumb or finger reach, with sufficient spacing to prevent accidental taps. Ex - Spacing around tapable elements and sizes for tapable elements have been defined at a component level in the library.

Organise content facilitating intuitive navigation by aligning with familiar patterns for the user, thus enhancing usability and engagement. Ex - All demog fields to be clustered together in a form.

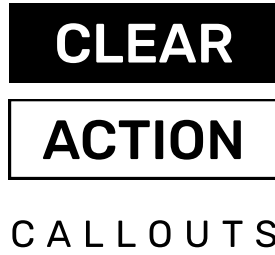

Reduce
Cognitive Load

Reduce cognitive load by prioritising information and actions on a page so that the user can consume only what's important in the context of their current journey. Ex - Limiting the no. of fields shown to a user in a particular stage.

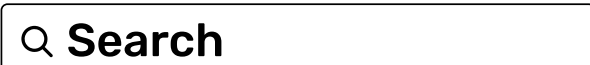

PRIORITY
FLOWS

Must be accessible

Identify and highlight all the primary actions and objectives of a particular page within the 1st 2 folds.

Make interactive elements, such as buttons or links, visually prominent and distinct to encourage user interaction. Use clear labels, contrasting colors, and appropriate sizing to draw attention to actionable items. Ex - Colors and sizes of all interactive elements are defined in the library.

everywhere

Have a search bar that lets you find stuff easily wherever you are on a website or app. This helps you quickly get to what you need, making it easier to use and more helpful.
